The method is used for treating allergic conditions, e.g. hay fever, asthma, atopic dermatitis and food
                              The present sequence is a peptide used as substrate for a cathepsin S inhibition assay. The Km for the substrate is around 5 uM but the presence of substrate inhibition makes kinetic analysis difficult. With 20 uM substrate, the assay rate is linear over the range of 1-8 ng cathepsin S in 100 ul reaction. Using 2 ng/well of cathepsin S, the production of product is linear and yields about 7-fold signal after 20 min with only 20% loss of substrate. Primary assays are run by quenching the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       allergies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the treatment of allergic conditions, comprising the administration of a pyrazole derivative. The activity of derivatives of the invention may be described as, antiallergic, antiasthmatic and dermatological. They act as cathepsin S inhibitors and may be used for the treatment of allergic conditions including atopic allergies, e.g. hay fever, asthma, atopic dermatitis, food allergies and allergies to dust, pollen, mold, pet dander or pet hair. The current sequence represents a cathepsin S inhibition assay substrate peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tays

The present sequence is a peptide used as substrate for a cathepsin S inhibition assay. The Rm for the substrate is around 5 uM but the presence of substrate inhibition makes kinetic analysis difficult. With 20 uM substrate, the assay rate is linear over the range of 1-8 ng cathepsin S in 100 ul reaction. Using 2 ng/well of cathepsin S, the production of product is linear and yields about 7-fold signal after 20 min with only 20% loss of substrate. Primary assays are run by quenching the reaction after 20 min and then measuring the fluorescence. For other assays, measurements are taken every min for 20 min. The rate is calculated from the slope of the increase and the percent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         comprising administration of a composition comprising a substituted pyrazole (I) or a salt, amide or ester. The method is used for treating allergic conditions, e.g. hay fever, asthma, atopic dermatitis and food allergies. The present sequence represents human cathepsin S substrate peptide used in an assay to demonstrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cathepsin S; inhibitor; allergy; hay fever; asthma; atopic dermatitis; antiallergic; antiasthmatic; dermantiinflammatory; immunosuppressive.

               The invention describes an isolated mammalian secreted polypeptide (MSP) CC (II) (I) is useful to direct the secretion of other proteins of interest from a host cell, to monitor secretion of proteins, to degenerate comparising all nucleotide sequences encoding a particular polypeptide, to screen for cell metabolism effecting receptors, for identifying new target receptors and drug design, for identifying, for comparising the weight of expressed MSP comparisities as a ratio to total protein expressed, for identifying polypeptides as a ratio to total protein expressed, for identifying polypeptides as a ratio to total protein expressed, for identifying comparison acid sequence analysis, for monitoring biological activities of the protein in vitro and in vivo, and to teach analytical skills and as reagents for the study of cells, receptors, and other binding molecules. The polynucleotide is useful for radiation hybrid mapping, and somatic contiguous maps of mammalian chromosomes. Reagents disclosed in the contiguous maps of mammalian chromosomes, Reagents disclosed in the over or under production of the protein. This is the amino acid sequence of a mammalian secreted polypeptide, described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

The present invention relates to the use of cathepsin S inhibitors to treat an allergic condition, especially an atopic IgE-mediated allergic condition such as hay fever, asthma, atopic dermatitis or a food allergy (claimed). The allergens may include dust, pollen, mould, and pet
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel isolated mammalian secreted polypeptide useful in therapeutic and diagnostic methods, to direct secretion of other proteins of interest from host cell, as educational tools, and as laboratory practicum kits

                                                                            The present sequence is encoded by a liver associated gene. The expression level of this gene changes in liver (hepatic) cancer. Liver associated gene can be used as markers in blood tests for screening for the early stages of the liver cancer. The encoded proteins and peptides can also be used as targets for screening for compounds to treat the disease. They can also be used for predicting the progress of the disease.
                                                                                                                                                                             New genes and their proteins found in hepatic cancer, vectors, antibodies, and screening method for compounds with binding ac useful as diagnostics and targets for treatment agents .

                                                                                                                                                                                                                                                                              The present invention describes primer sets for synthesising 5602 CC full-length cDNAs defined in the specification. Where a primer set CC comprises: (a) an oligordT primer and an oligonucleotide comprises one of the 5602 nucleotide sequences defined in the specification, where the CC cligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the CC complementary strand of a polynucleotide which comprises a 5'-end cC sequence and an oligonucleotide comprising a sequence, where the CC oligonucleotide which comprises a 3'-end sequence, where the CC oligonucleotide comprises a 3'-end sequence, where the CC oligonucleotide comprises a 3'-end sequence, where the 10 septimers are useful for synthesising polynucleotides, of the 5'-end sequence/3'-end sequence is selected from those defined in CC the specification. The primer sets can be used in antisense therapy and CC in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH1372 represent human cDNA sequences; AAB92446 to cahes of the present oligonucleotides, all of which are used in the exemplification of the present oligonucleotides, all of which are used in the exemplification.

                                                                                                                                                                                                                             AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ54473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fraser C,

                                                                                                                                                                                                                                                                                                                                               AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (CHIR )

                                                                                                   represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ54737 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sette A,
Baker DM,
                                                                                                                                                                                                                                                                                                                                 escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups (CTL and HTL), and further, to modify the composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABPIIS01 to ABP25412 represent peptide sequences used in the exemplification of the present

                                                                                                                                                                                                                                                                                               Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                               CC The present invention describes a composition (1) comprising a prepared CC human immunodeficiency virus-1 (HIV-1) group comprising an amino acid Sequences calected from 51 defined amino acid sequences (ABL25347 to CC ABP25397). (1) has virucide activity and can be used in vaccines. (1) CC may be used for immunising subjects against HIV-1 infections. The use of Group-based vaccines has several advantages over traditional vaccines (CC compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen. (CC allowing for immune escape due to mutations. The groups for inclusion in CC an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of CC escape mutants. Furthermore, immunosuppressive groups that may be present CC in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups (CTL and HTL), and further, to modify the CC immunogenicity. Accordingly, the immune response can be modulated, as CC appropriate, for the target disease. Similar engineering of the response CC invention.

CC invention.

CC human immunodeficiency virus-1 (HIV-1) group comprising an amino acid compensation of the virus-1 (HIV-1) group comprising an amino acid composition of the use of CC ABP25397). (I) has virucide activity and can be used in vaccines. (I) CC may be used for immunising subjects against HIV-1 infections. The use of CC group-based vaccines has several advantages over traditional vaccines, CC particularly when compared to the use of whole antigens in vaccines compositions. There is evidence that the immune response to whole callowing for immune escape due to mutations. The groups for inclusion in CC allowing for immune escape due to mutations. The groups for inclusion in CC escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups (CTL and HTL), and further, to modify the composition of the groups, achieving, for example, enhanced as a compropriate, for the target disease. Similar engineering of the response can be modulated, as corresponse to the persons of the present persons that traditional approaches. ABP11501 to ABP25412

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC The invention relates to a purified polypeptide having luciferase CC activity and a recognition site specifically cleavable by a protease, CC where cleavage results in a decrease in luciferase activity. The CC polypeptide comprises a localisation sequence which is linked to the CC luciferase polypeptide by the cleavable recognition sequence. The CC luciferase polypeptide by the cleavable recognition sequence. The CC modulator, an inhibitor of apoptosis and for detecting luciferase activity in a sample. The polypeptide is used for characterising and CC identifying cellular processes associated with metabolism, cell growth CC and cell death e.g. apoptosis and for measuring protease activity. The CC and cell death e.g. apoptosis and for measuring protease activity. The CC cellular biochemical pathways are useful for characterising, identifying CC cellular biochemical pathways as well as identifying diagnostic and CC determining amount of protease in a sample and for monitoring the cCC activity of protease inside a cell that expresses a recombinant collections. The present sequence is a protease peptide used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

CC and a protease, where cleavage of the PRS lelavable by a virally encoded CC protease, where cleavage of the PRS leads to a detectable signal. The CC nucleic acid construct of the invention is useful for uncovering CC molecules having antiviral activity or for determining viral drug CC resistance and the chimeric peptide is also useful for detecting the CC presence of a virus in a cell. Other uses of the invention are detecting to researce of viral infection. The nucleic acid construct is useful for CC phenotypic testing of human immunodeficiency virus (HIV) drug resistance. CC The invention enables screening of molecules in an easy and rapid manner CC and allows efficient detection of the presence of viral protease and CC viral particles within cells. The construct is specific, sensitive and CC lacks background enzymatic activity in the absence of human CC immunodeficiency virus protease, and is suitable for detection of CC specific viral strain isolates even under low viral load conditions. When used for phenotypic testing of HIV drug resistance it delivers accurate cresuits within 24 hours. The present amino acid sequence represents one of several (AAU75794-AAU75798) HIV Gag protein protease cleavage

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              B3E17/PTROPT, B3E16, B4E17 AND B4E16; ARE PRODUCED BY ALTERNATIVE SPLICING. ISOFORMS ALEI7, AZE17, A3E17, A4E17, ASE17 AND A6E17 ARE ACIDIC WHILE ISOFORMS B1E16, B2E16, B3E17, B3E16, B4E17 AND B4E16 ARE BASIC.

-!- TISSUE SPECIFICITY: EXPRESSED PREDOMINANTLY IN SKELETAL MUSCLE.
-!- DEVELOPMENTAL STAGE: EMBYO AND NEONATE EXPRESS PREDOMINANTLY ACIDIC ISOFORMS WHILE ALL ADULT ISOFORMS ARE BASIC. ONLY ONE ISOFORM, B2E17, IS FOUND IN BOTH EMBRYO/NEONATE AND ADULT. A TRANSITION FROM HIGH TO LOW MOLECULAR WEIGHT ISOFORMS IS ALSO SEEN DURING POSTMATAL LEVELOPMENT.

      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score

Cell 41:67-82(1985),

-1- FUNCTION: TROPONIN T IS THE TROPOMYOSIN-BINDING SUBUNIT OF TROPONIN, THE THIN FILAMENT REGULATORY COMPLEX WHICH CONFERS CALCIUM-SENSITIVITY TO STRIATED MUSCLE ACTOMYOSIN ATPASE ACTIVITY.

-1- ALTERNATIVE PRODUCTS: AT LEAST 44 ISOFORMS ARE PRODUCED BY ALTERNATIVE SPLICING. THE ALPHA AND BETA FORMS ARE PRODUCED BY THE USE OF MUTUALLY EXCLUSIVE EXONS.

1- SIMILARITY: BELONGS TO THE TROPONIN T FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Troponin TnTF).

                                                                                                                                                                    Skeletal muscle troponin T.".

J. Biol. Chem. 263:18816-18820(1988).

-:- FUNCTION: TROPONIN TIS THE TROPOMYOSIN-BINDING SUBUNIT OF TROPONIN, THE THIN FILAMENT REGULATORY COMPLEX WHICH CONFERS CALCIUM-SENSITIVITY TO STRIATED MUSCLE ACTOMYOSIN ATPASE ACTIVITY.

-!- ALTERNATIVE PRODUCTS: AT LEAST 4 ISOFORMS; TNT-1, TNT-2, TNT-3 (SHOWN HERE) AND TNT-4; ARE PRODUCED BY ALTERNATIVE SPLICING.

-!- SIMILARITY: BELONGS TO THE TROPONIN T FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TRT3_CHICK STANDARD; PRT; 262 AA.

"Identification of sites phosphorylated in bovine cardiac troponin I and troponin T by protein kinase C and comparative substrate activity of synthetic peptides containing the phosphorylation sites.";

J. Biol. Chem. 264:20778-20785(1989).

-I- FUNCTION: TROPONIN T IS THE TROPOMYOSIN-BINDING SUBUNIT OF TROPONIN, THE THIN FILAMENT REGULATORY COMPLEX WHICH CONFERS CALCIUM-SENSITIVITY TO STRIATED MUSCLE ACTOMYOSIN APPASE ACTIVITY.

-I- ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; are produced by alternative splicing.

-I- SIMILARITY: BELONGS TO THE TROPONIN T FAMILY.
